OPERATING MANUAL

AUTHOR
ALARM

Dear car owner!

Please note that the AUTHOR Alarm's anti-theft devices are not intended for self-installation.

We strongly recommend to install and configure the purchased equipment only in certified installation centers.

General information

IGLA is unique device to protect your car from theft. The device has an innovative mechanism of engine locking that uses standard wiring of the car so there is no additional wiring that can be easily found. The security system can be deactivated using the key fob, smartphone or by entering the PIN-code from the standard vehicle buttons.

The device cannot be found by any known means. IGLA does not show itself until the engine is started. Moreover, due to its small size the device can be installed almost anywhere in the car.

IGLA is a new smart way to protect your car!

Benefits of the system

- Digital locking of the engine without intervention into the car control units and circuits.
- Smart locking of the engine based on the readings data from car sensors and car status analysis.
- The device does not show itself until the engine lock is activated.
- The key fob, smartphone or the PIN-code that you enter with the standard vehicle buttons can be used for security system deactivation.
- Use your smartphone as a key fob
- Service mode (with automatic log out option) or Transport mode
- Anti-Hi-Jack mode – locking of the engine in case of theft by violent means
- Comfort and Ventilation options.

OPERATION CONCEPT

Security deactivation

In order to start driving you should log into the system via one of the following ways:

- you should have the key fob or smartphone (paired to the system);
- enter a PIN-code using the standard vehicle buttons.

If the key fob was detected (PIN-code was entered correctly), the system will signal with indication, the engine will not be locked and you can start driving. If the key fob was not detected (PIN-code was incorrect or was not entered at all), IGLA will lock the engine.

In some car models the system switches to the engine start inhibit mode after the engine is shut off. In order to unlock the engine you should switch on the ignition without starting the engine (without pressing the brake pedal), enter the PIN-code and start the engine.

The locking method (engine start inhibit and/or locking of the running engine) depends of the IGLA system settings and the car brand/model.

The security system is activated in 10 seconds after the ignition is off.

Authorization with the key fob or with smartphone

ATTENTION! Do not leave the key fob (smartphone) inside your car when the ride is over. Otherwise the anti-theft functions will be deactivated.

In order to log into the system it is enough to have a key fob (if the key fobs were included into IGLA system set) or smartphone paired to the system (if the key fobs were not included into IGLA system set).

Get into the car and start up the ignition. When the key fob/smartphone is detected, the system will give out two verification signals (see the annex), after that you can start driving.

If the key fob/smartphone is not detected, there will be no verification signals and if one attempts to start driving or start up the ignition, the engine will be locked (see page 18).

Authorization with the PIN-code

The authorization method depends on the chosen way of engine locking, see page 18:

- If the system inhibits the engine start, the PIN-code should be entered before the start of the engine.
- If the system does not inhibit the engine start, the PIN-code can be entered both before the start of the engine or after.

ATTENTION! The initial PIN-code is set by the specialists of the service centre during the installation. Before running the system for the first time change the PIN-code and memorize a new one (see page 20).

Get into your car, start up the ignition, start the engine if needed and enter the PIN-code using the standard vehicle buttons*.

* Some buttons start functioning in 2-5 seconds after switching on the ignition or starting the engine (see the annex). Moreover, some buttons shall not be pressed quicker than one time per second.

It is recommended to enter the PIN-code right before the ride. The interval between the pressing of the buttons shall not exceed 2 seconds. There is no difference between long and short press of the button.

When the key fob/smartphone is detected, code there will be 2 indication signals (see the annex), after that you can start driving.

If the PIN-code is not correct, there will be no confirmation signals and if one attempts to start driving or start up the ignition, the engine will be locked (see page 18). The second attempt to enter the PIN-code is available in 5 seconds after the failed attempt to log in or after turning off the ignition for 10 seconds and starting the ignition again.

Anti-Hi-Jack mode

This mode allows to prevent the violent theft of the car. In case of hijack it enables the engine locking when the car is at the safe distance from the car owner.

ATTENTION! If you need Anti-Hi-Jack mode to be activated you should switch it ON. **By default, the Anti-Hi-Jack mode is switched OFF.**

In order to **switch ON** Anti-Hi-Jack mode do the following:

1. Switch on the ignition without starting the engine and enter the PIN-code to authorize.
2. Press the accelerator pedal* as far as it can go and keep it pressed.

* For some car models other controls are used instead of an accelerator pedal (see the annex).

3. Press the service button 16-times (16 indication signals will confirm that this mode is switched on).
4. Release the accelerator pedal.

The «Anti-Hi-Jack» mode will be triggered automatically if the following conditions are met:

- you are logged into the system (via key fob, smartphone or PIN-code)
- the engine is running
- the driver's door was opened for more than 3 seconds
- the brake pedal is not pressed

After the «Anti-Hi-Jack» mode was triggered by the theft and the car has travelled 300 meters the external light-signals* will start flashing (brake lights/parking lights and alarm lights) warning the other drivers about the possible stop. At the same time inside the car there will be the quickening light and sound signals.

In 20 seconds after the warning signals started the alarm switches on (the horn signal and the alarm lights) and the engine will be locked. The engine will be locked only then the car stops or it has low speed (up to 30 km/h).

The Anti-Hi-Jack engine locking can be deactivated any time after its triggering by entering the valid PIN-code when ignition or engine is on. The Anti-theft mode is not deactivated if the key fob or smartphone is inside the car – only PIN-code entering can deactivate this mode.

* The signals depend on a car brand/model.

Service mode

The service mode is used for a temporary deactivation of the anti-theft device when you give your car for the maintenance (without giving away the PIN-code and saying about the device).

It is better to activate the service mode before the ignition or the engine is off at the end of the trip.

After the authorization (after the PIN-code is entered) press the service button 5 times.* The interval between presses shall not be more than 2 seconds. The activation of the service mode will be confirmed by 5 indication signals**.

The service mode can be deactivated in two different ways:

1. Automatically – when you finished driving and the speed during your ride had reached 50 km/h at least once and the car had been in motion at least 3 minutes without stops (or with stops that were not longer than 3 minutes).
2. Manually – via entering valid PIN-code.

The double indication signal will show that the service mode is deactivated.

After the deactivation of the service mode next time the ignition is switched on or the engine is started you will have to use the key fob, smartphone or enter the PIN-code before the ride.

* See the annex.

** The signals depend on a car brand/model.

Transport mode

The transport mode is used for temporary switch off the anti-theft system IGLA and in comparison to the Service mode it can be deactivated only via entering PIN-code.

This mode should be used when you do not want the security functions of the IGLA system to start automatically when you start driving and increase the speed. This mode can not be deactivated automatically when the speed is reaching 50 km/h.

In order to activate the transport mode one needs a plastic card with an individual secret code, hidden under a protective layer. The card is a part of the anti-theft system set.

1. Switch on the ignition without starting the engine.
2. Press the brake pedal and while keeping it pressed press the **accelerator*** pedal a certain number of times as far as it can go where the number is equal to the first figure in the emergency code. Release the brake pedal. The first figure of the code will be entered.
3. Input all the rest figures of the emergency code in the same way (see item 2).

If the PIN-code is correct, the device will pass into the PIN-code change mode and will give out indication signal every 3 seconds. Press the service button 5 times.** The interval shall not be more than 2 seconds. The activation of the Transport mode will be confirmed by 5 indication signals.***

* For some car models other controls are used instead of an accelerator pedal (see the annex).

** See the annex.

*** The signals depend on a car model.

In order to deactivate the transport mode enter the valid PIN-code. The 2 indication signals will show that the service mode is deactivated.

Protection from key programming

Protection from key programming (key cloning) is available for some car models (find more info at our web-side author-alarm.com, in section System compatibility). This option protects the car from programming a new chip for car key that could be used by criminals to start the engine.

If you need to program a new car key in the service centre the Service mode shall be switched on. You can do it via Author Config app or manually – press Service button 5 times after the authorization in the system was successful and the engine is running.

Use your smartphone as a key fob

In order to authorize automatically your smartphone can be used as a key fob if there is no key fobs in the IGLA system set.

The car-owner can log into the system manually via entering the PIN-code or automatically using smartphone with IGLA app running in the background mode.

Currently this option is available for the following phones:

iOS	Android
Smartphones supporting iOS 8 or higher	Smartphones supporting: <ul style="list-style-type: none">• Android 5.0 or higher• Bluetooth 4.0+ (LE)

IGLO

AUTHORISATION

INFORMATION

SETTINGS

● offline

Download and install IGLA app using the link or QR-code below:

<https://itunes.apple.com/ru/app/igla/id1068014851?mt=8>

<https://play.google.com/store/apps/details?id=com.dma.author.igla>

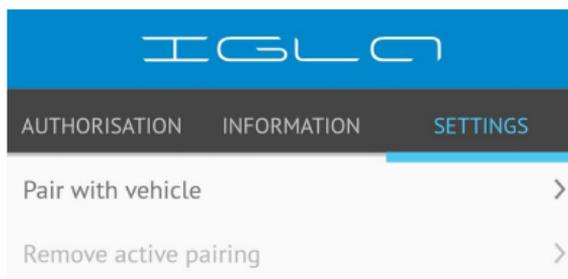

ATTENTION! Only one smartphone can be used as a key fob.

ATTENTION! Before pairing your smartphone with IGLA system we recommend to switch off all Bluetooth connections in your smartphone with all other devices (Bluetooth module must be ON!). Otherwise the connection with IGLA might not be established.

To pair your smartphone with IGLA system it is necessary to do the following:

1. Switch on Bluetooth in your smartphone.
2. Start IGLA app.
3. Authorize in IGLA system via PIN-code.
4. Activate the PIN-code change mode (press the accelerator pedal as far as it can go (or other control element), enter current PIN-code and release the accelerator pedal). The indication signal will start flashing once in 3 seconds.

5. Press the service button 1 time.
6. Go to the tab «Settings» in IGLA app.
7. Press «Pair with vehicle».

8. Follow the instructions shown on the screen and then press «NEXT».

9. In a pop-up window enter the Bluetooth pairing code indicated on the plastic card supplied as a part of the set. After this your smartphone will be connected to IGLA system.

10. On the tab «Authorization» press the «Key» button in the centre of the screen in order to activate the key fob mode. The color of the «Key» button will change from grey to blue.

Now your smartphone will be functioning as a key fob. The connection to the IGLA system is done via the encrypted channel.

ATTENTION! Smartphone functioning as a key fob only when Bluetooth is switched ON.

The smartphone as key fob is activated at distance from 0,5 to 10 meters from the car depending on the installation place of IGLA system.

If the connection of smartphone to IGLA system was not successful, it is recommended to delete all previously connected smartphones via changing the current PIN-code to the same PIN-code and delete Bluetooth connection between the devices in your smartphone:

Settings – Bluetooth – Devices – IGLA – Delete connection (pairing).

ATTENTION! In case the smartphone is lost for security reasons delete it from the memory of the IGLA system. In order to do that change the current PIN-code to the same PIN-code (see page 20).

When the PIN-code is successfully changed - there will be 2 indication signals. When the smartphone is successfully deleted from memory - there will be 2 double indication signals.

It is recommended to do this procedure right after the smartphone is lost.

If it is necessary to delete your smartphone form the IGLA system, do it in the IGLA app on the tab «Settings».

ADDITIONAL FEATURES

Additional options are activated/deactivated according to the item «Options of the anti-theft IGLA system», page 25.

ATTENTION! The additional options are supported depending on the car model and its configuration.*

«Comfort» option

Some car models* support Comfort option that closes windows and the sunroof when the security system is activated using a standard key fob. This option is on by default.

Ventilation option

Some car models* support Ventilation option that opens the windows after a triple click on a standard key fob for security system deactivation. This option is off by default.

Opening and closing of a central lock in a particular case

For some car models* the security of a driver is protected by an option of a central lock closing when the speed exceeds 10 km/h. This option is activated once after the ignition is started. The option of a central lock closing is on by default.

For the cars with the ignition key the central lock opens when the key is pulled away from the ignition. If a car has a START-STOP button the central lock opens when

* See the section System compatibility on the web-site author-alarm.com

the ignition is off. The option functions only after the authorization. By default the central lock opening option is off.

Additional options

There are additional options for some car models*, e.g. automatic shutdown START-STOP, indication signal change etc.

* See the section System compatibility on the web-site author-alarm.com

SYSTEM SETTING

Engine locking

The anti-theft system IGLA prevents the car theft by stall of the running engine the engine start inhibit.

The method of locking is set automatically when the device is connected to the car:

- for some car models only the engine start inhibit is available;
- for some car models it is only possible to stall the running engine;
- for others both methods are available. In order to deactivate the engine start inhibit see the item «Options of the anti-theft system IGLA», page 25.

An additional locking circuit is activated at the attempt of driving without authorization (or in Anti-Hi-Jack mode) when there is no data in the CAN-bus that needed for the IGLA system or the digital locking has failed. In other cases the activation of the additional circuit is impossible.

To deactivate the engine locking enter the current PIN-code or switch off the ignition for more than 10 second.

PIN-code setting

1. Make sure the ignition is switched on, the red and the grey wires are connected to permanent power supply «+», the device is in PIN-code setting mode (the indication signal flashes every 3 seconds).
2. Enter a PIN-code using the buttons available for programming (see the annex). **Every click shall be**

followed by an indication signal. The number of clicks shall be in the range from 3 to 20 clicks. The interval between clicks shall not be more than 2 seconds. There is no difference between long and short press of the button.

Different combinations of buttons and their order can be used, e.g. if you press CRUISE ON/OFF two times and press CRUISE SET- once, the system will save all the clicks in this order. When the PIN-code is entered there will be 3 indication signals.

3. Enter the current PIN-code once again. If the PIN-codes match then there will be 2 signals and the **PIN-code will be successfully saved.**

If there are 4 indication signals, it means the PIN-codes do not match and the **PIN-code has not been saved.** Turn off the ignition and repeat the items 1-3

4. Turn off the ignition.
5. Disconnect the RED and the GREY wires from the permanent power supply «+» in order to reload the device.
6. Connect the RED wire to the power supply circuit (do not connect the grey wire!).

ATTENTION! If the initial PIN-code is set by the specialists of the service centre during the installation, it is strongly recommended to change it and memorize a new one (see below).

Device number check

This check is necessary to confirm the connection between the plastic card with codes and the installed device. **If the open code card number does not match with the device, the only way to change the forgotten PIN-**

code for the new one will only be possible in a specialized service centre.

It is recommended to do this check right after one gets the car with the installed anti-theft system IGLA from the service centre.

1. Switch on the ignition without starting the engine.
2. Press the brake pedal and while keeping it pressed press the accelerator* pedal a certain number of times as far as it can go where the number is equal to the first figure in the open card number (indicated on the plastic card). Release the brake pedal. The first figure of the open code will be entered.
3. Input all the rest figures of the open code in the same way (see item 2).

If the code number is correct, the system will signal with 2 flashes. If nothing happens, that means the number was entered incorrectly or it does not match with the installed device number.

Change of the PIN-code

The PIN-code set in the service centre shall be changed when the car-owner get his/her car back from the service centre with the anti-theft system IGLA installed. Also it is recommended to change the PIN-code if you suspect someone has watched you entering the PIN-code.

1. Switch on the ignition without starting the engine.
2. Enter the current PIN-code to authorize. There will be 2 indication signals.

* For some car model other controls are used instead of an accelerator pedal (see the annex).

3. Press the accelerator pedal* as far as it can go and keep it pressed.
4. Enter the current PIN-code once again. The device will pass to the PIN-code change mode and the indication signals will start flashing every 3 seconds. Release the accelerator pedal*.

ATTENTION! If the current PIN-code includes «Slight touch on accelerator pedal», after the authorization (item 2) it is necessary to enter the PIN-code once again and then press the accelerator pedal as far as it can go and keep it pressed until indication appear. Then perform item 5.

5. Enter the new PIN-code using the buttons available for programming (see the annex). **Every click will be followed by the indication signal.** The number of clicks shall be in the range from 3 to 20 clicks. The interval between clicks shall not be more than 2 seconds. There is no difference between long and short press of the button. Different combinations of buttons and their order can be used, e.g. if you press CRUISE ON/OFF two times and press CRUISE SET- once, the system will save all the clicks in this order. When the PIN-code is entered there will be 3 indication signals.
6. Enter the current PIN-code once again. If PIN-codes match then there will be 2 indication signals and the **PIN-code will be successfully saved.** If there are 4 indication signals, it means the PIN-code do not match and the **PIN-code has not been saved.** Turn off the ignition for 3 sec. and repeat the items 1-6.
7. Turn off the ignition.

* For some car model other controls are used instead of an accelerator pedal (see the annex).

ATTENTION! Memorize the PIN-code or write it down after it has been changed. **Do not leave the PIN-code and the plastic card with the emergency code inside the car!**

PIN-code emergency resetting

In case the current PIN-code is lost the car-owner can reset it and set the new one. In order to reset the PIN-code one needs the plastic card with an individual emergency code, hidden under the protective layer. The card is a part of the anti-theft system IGLA. Prepare the card before the PIN-code resetting procedure.

1. Switch on the ignition without starting the engine.
2. Press the brake pedal and while keeping it pressed press the accelerator* pedal a certain number of times as far as it can go where the number is equal to the first figure in the emergency code. Release the brake pedal. The first figure of the code will be entered.
3. Input all the rest figures of the emergency code in the same way (see item 2).

If the PIN-code is correct, the device will pass into the PIN-code change mode and will give out indication signal every 3 seconds. If there is no indication, the code is incorrect. In this case turn off the ignition and repeat the steps for resetting.

If the resetting was successful and the device switched to the PIN-code changing mode please enter the new PIN-code (3-20 clicks). Different combinations of

* For some car model other controls are used instead of an accelerator pedal (see the annex).

buttons and their order can be used, e.g. if you press CRUISE ON/OFF two times and press CRUISE SET-once, the system will save all the clicks in this order. When the PIN-code is entered there will be 3 indication signals. Enter your PIN-code once again.

If PIN-codes match then there will be 2 indication signals. The device saves the new PIN-code and switches to the standard mode. If there are 4 indication signals, it means the PIN-code do not match. In this case repeat all of the steps for PIN-code resetting, beginning with step 1.

Connection and deleting of key fobs

In order to connect a new key fob do the following:

1. Remove the battery from the key fob.
2. Start the key fob connection mode
 - Switch on the ignition without starting the engine.
 - Authorize in the system via PIN-code.
 - Press the accelerator pedal as far as it can go and keep it pressed*
 - Enter the PIN-code once again
 - Press the Service button** 2 times.
3. **For M52 key fobs** (see marks on electronics board).

Insert the battery into the new key fob. The LED on key fob will start flashing continuously with green light. It is recommended to put the key fob closer to the IGLA system during the procedure of connection.

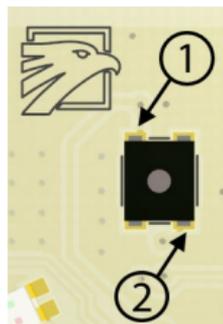

* For some car model other controls are used instead of an accelerator pedal.

** See the annex.

(The interaction radius during connection procedure is limited). After the successful connection the LED will blink once with red light. If the connection failed, the flashing stops in 30 seconds after the battery is inserted. Be sure to check the key fob operation after connection it to the device.

For M51, M24, key fobs (see marks on electronics board)

Close the key fob contacts shown on the right drawing and insert the battery. The LED indication will start flashing green every second and when the key fob is connected it will flash red once.

ATTENTION! The old key fob (from the IGLA system set) cannot be connected to the device. Use only new key fobs bought from the manufacturer.

If you lost key fob erase it from the device memory to prevent the car theft.

To erase the key fob change the current PIN-code to the same PIN-code (see page 20), do not switch off the ignition and press the service button* 10 times. Press the button within 10 seconds after PIN-code confirmation. If the PIN-code is successfully changed the indication signals twice. If the key fob was successfully erased there will be two double signals.

ATTENTION! During this procedure all saved in the memory key fobs and smartphones will be erased! Key fobs that were saved in the memory and then erased cannot be added to the memory once again.

* See the annex

REFERENCE INFORMATION

Options of the anti-theft system IGLA

ATTENTION! The options are supported depending on a car model (see the section «System compatibility» on the web-site author-alarm.com).

Option	switched ON	switched OFF
Service mode	5	Automatically or using PIN-code
Opening of the central lock in a particular case*	6	7
Closing of the central lock at speed > 10 km/h	8	9
Ventilation	10	11
Comfort	12	13
Mirror fold	14	15
Anti Hi-Jack	16	17
Engine start inhibit**	18	19
Additional option	20	21

* Cases for central lock opening:

- for the cars with the ignition key the central lock opens when the key is pulled away from the ignition.
- for the cars with START-STOP button the central lock opens when the ignition is off.

** Initial status of an option depends on the car model (see the section «Supported cars» on the web-site author-alarm.com). When this option is switched OFF the IGLA system stalls the running engine via the CAN-bus or additional circuit (depending on the IGLA system installation).

The state of option set in the system by default («Switch ON», «Switch OFF») is marked with grey color in the table. The figures in the table show how many times the service button shall be pressed to choose a particular option state.

For some car models (see the section System compatibility on our web-site author-alarm.com) some additional options are possible. For example: automatic switch off START-STOP function, indication signal change, etc.

In order to change the option state do the following:

1. Switch on the ignition without starting the engine and enter the PIN-code to authorize.
2. Press the accelerator pedal* as far as it can go and keep it pressed.
3. Press the service button the number of times needed to reach the particular state – «Switch ON» or «Switch OFF» (see the figures in the corresponding column in the table). For example, 16 times to switch the Anti Hi-Jack mode ON or 17 to switch it OFF. The indication signals will confirm the action. The option state will be changed.
4. Release the accelerator pedal*.

ATTENTION! If the «Slight touch on accelerator pedal» is used as a service button, after the authorization in the system (item 1) perform the item 3, then press the accelerator pedal as far as it can go and keep it pressed until you see the indication.

* For some car model other controls are used instead of an accelerator pedal (see the annex).

Add-in modules for the standard functions of IGLA

CONTOUR

CONTOUR, a control module for the hood catch, secures the under hood space when working together with the IGLA system. Apart from the hood catch control there is an option for the control of the additional normally closed locking relay.

The hood catch is closed in the following cases:

- The car security is active (the central lock is closed)
- In 10 seconds after the ignition is off
- The Anti Hi-jack mode is active

The hood catch cannot be closed if the hood is open. The hood catch is unlocked after the authorization in the IGLA system.

OBD BLOCK

OBD BLOCK system is made to prevent the diagnostic outlet OBD-II from the unauthorized access. The system allows to prevent the tweaking of standard software aimed to bypass the anti-theft system in cases of unauthorized access to the diagnostic outlet.

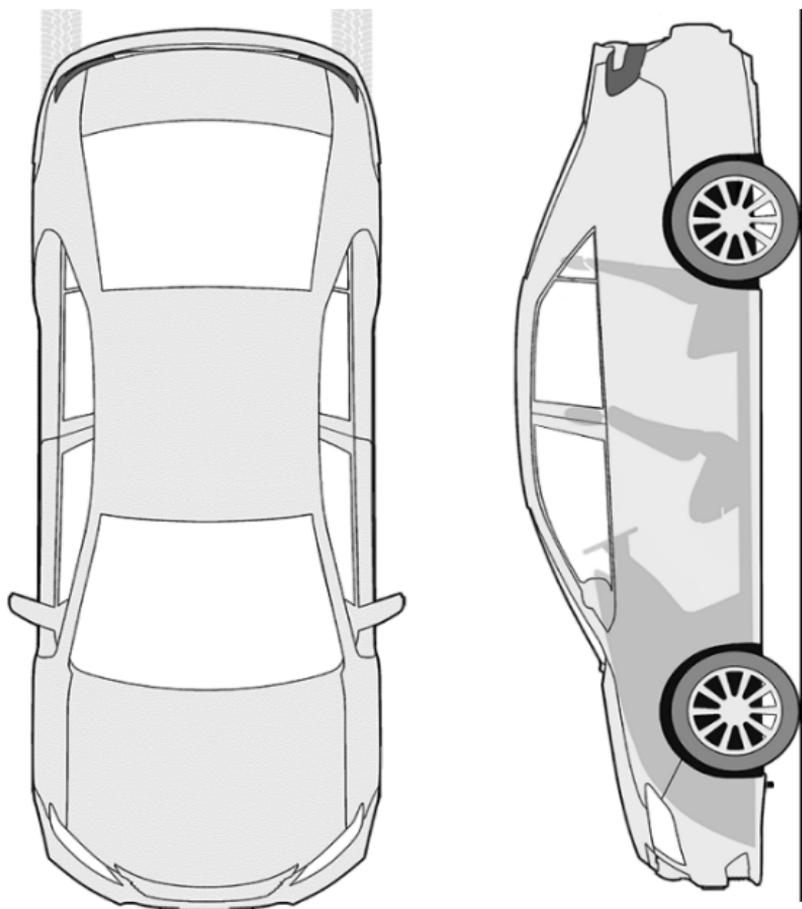

TOR

TOR – a digital CAN-bus relay aimed to provide complex protection of car with the IGLA system installed.

TOR uses the additional locking circuit that is activated in case the connection with the engine control unit via CAN -bus is faulty or disrupted. Locking allows to activate the Operating engine shutoff option and Anti Hi-Jack options for car without digital locking of an operating engine.

Visit our web-site author-alarm.com to order the additional options.

Place of device installation

ATTENTION! Keep the PIN-code in mind or write it down after you have changed the PIN-code. **Do not leave the plastic card with the code as well as this guide inside the car!**

Specifications

Current consumption in a standstill mode (the ignition is off)	6-8 mA
Operating voltage	6-15 V
Radio-channel frequency	2,4 GHz
Battery life	6 months
Key fob battery type	CR2032

List of standard equipment

Anti-theft system IGLA	1 pcs
Operating manual	1 pcs
Installation manual	1 pcs

WARRANTY CERTIFICATE

Warranty is 12 months from the date of the purchase. During this period technical support and maintenance are guaranteed for free.

The warranty does not apply to the items with:

- mechanical damage, burnt and char pieces, components, conductive tracks etc.;
- traces of an independent repair;
- damage caused by natural hazards, fire, social factors;
- violation of the tamper-evident seal, damage or absence of a factory/trade label.

Only items in complete set and with the original packing are taken for warranty repair.

Absence of packing is regarded as noncompliance with transportation rules. The warranty does not apply to the damage incurred to another equipment operating together with this device.

Item (model) _____
